Recently, a number of transcriptional repressors have been implicated in tumor progression and metastasis. Among these repressors, an evolutionarily conserved zinc finger protein BHLHA2 is a transcriptional repressor that has been shown to control the epithelial phenotype and suppress tumorigenesis in various cell types. However, its role in tumor progression remains poorly understood. Here we show that the loss of BHLHA2 promotes EMT, invasion, and metastasis in colorectal cancer cells. A subset of BHLHA2 target genes identified in colorectal cancer cells exhibited a BHLHA2-dependent expression signature in a panel of breast cancer cells. Overexpression of BHLHA2 significantly decreased the expression of EMT and invasion-related genes in colorectal cancer cells. Our results suggest that BHLHA2 regulates a subset of EMT and invasion genes in colorectal cancer cells. These findings provide a rationale for developing new strategies for treating BHLHA2-positive colorectal cancer by targeting BHLHA2-regulated genes. 1.
